

## Geo energy Europe at the European Geothermal Congress 2022

The geothermal community met in Berlin for the European Geothermal Congress (EGC) 2022, in a country that has made geothermal a priority for its energy transition.

More than 1200 participants joined the European Geothermal Congress. The event, organized by the European Geothermal Energy Council (EGEC), in cooperation with the German Geothermal Association (Bundesverband Geothermie e. V.), brought together stakeholders from the entire geothermal community to discuss latest innovations, science, market development, and for networking with an exhibition and side events.

The geothermal sector presented its solutions to solve the current energy crisis. Geothermal energy offers a renewable and affordable source, for a local and secure energy supply to families and the industry.

Geothermal has been experiencing significant market growth all over Europe, notably in the heating sector. The city of Munich by itself has allocated 1 billion euros for future geothermal district heating development.

The GEO-ENERGY EUROPE project had a booth on the building of the congress centre and Project Coordinator, AnaLuisa Lavado (Geoscience Ireland) delivered a poster speech and presentation.
